## **Executive Summary**

Let's summarize the key points of this report.

# **1 Introduction**

Standardized catch-per-unit-effort (CPUE) indices provide essential data for fisheries stock assessments by tracking relative abundance trends over time ([Maunder & Punt, 2004](#)).

## **1.1 Study Objectives**

Let's do something interesting here.

# **2 Methods**

## **2.1 Data and Study Area**

# **3 Results**

## **3.1 Model Convergence**

Please converge!

# **4 Discussion**

## **4.1 Model Performance and Selection**

Model performance was evaluated using Akaike's Information Criterion (AIC) and Bayesian Information Criterion (BIC). The selected model demonstrated superior fit compared to alternative specifications, as indicated by lower AIC and BIC values. Residual diagnostics confirmed the adequacy of the model, with no significant patterns observed in residual plots.

# **5 Conclusions**

Let's wrap things up here.

# **Acknowledgments**

We thank everyone who contributed to this work.
